

MANAGED SERVICES

SafeGuard™

Complete Offsite Backup Solution

Any document, spreadsheet, or other file is at risk if it exists in only one location. Hard drive malfunction, computer viruses, fire and human error can obliterate weeks or months of work in an instant!

When evaluating data protection procedures consider:

- Reliability of backups in the event of a disaster
- Scalability to assist in growth planning
- Security of data
- Fast access to backed up data in the event of a loss
- Costs of implementing backups
- Reliability and quality of backup procedures
- Comprehensive solution for all applications and data locations

Benefits

- Guaranteed security
- Daily backups of your environment
- Exception notification. If your job or portion of a job fails, CDW will notify you via email
- A monthly invoice detailing the amount of storage you are using
- 30-day trial period

SafeGuard™ is an e-Vaulting service that gives you state-of-the-art data protection at an affordable price. Data from your server(s) is backed up through the SafeGuard™ Client, and sent through a telecommunications line to an off-site data vault. Ease of use comes from the 'agentless' architecture: you only need to install SafeGuard™ on one computer (thereby eliminating the need to install software on each target backup/restore computer). As long as that computer is networked with the target backup/restore computers, you will be able to browse data, back it up, and restore it as required. As an e-Vaulting service: you only pay for the data you store online at the off-site data vault (SafeGuard™ Client).

During backups, SafeGuard™ extracts, compresses, and encrypts items you specify for backup. Only new or modified data is backed up, thereby accelerating the transmission time. Backup data is sent via the Internet, Intranet, or direct dial-up to the secure, off-site Data Center that hosts the SafeGuard™-System Vault. Restores are performed on demand, via the same SafeGuard™-Client installation, once the DS-Client's security measures have been cleared.

Fully Automated Solution

We secure your valuable information by offering the leading technology available in data protection: SafeGuard™ Internet Vaulting. SafeGuard™ is a fully automated data backup and recovery process that inexpensively stores your critical data at a secure offsite location. It eliminates the need for equipment purchases, cumbersome tape backups and unreliable manual procedures.

Guaranteed Security

We are committed to delivering superior backup and restore services with the highest levels of security and encryption. Our secure data vaults are housed in premier collocation facilities, which maintain 99.999% power and Internet bandwidth availability. Network Partners guarantees you the best Internet Vaulting service available.

Affordable, Low Market Pricing

This product is priced per GB, per month at the total storage space your vault is holding in a compressed state. Our compression ratio is roughly 2 to 1.

Minimal Client Responsibility

Client will provide the NPI engineer with remote access to the environment to the extent needed to set up the system. The NPI engineer will need to know the number of days of retention to maintain. Default is three days. This does affect the size of your repository. Saving only one day will significantly reduce the size of your repository, but increases the chance of a corrupted file being saved and part of the repository and of no value restored.

Notification if Backups Run Incorrectly

Should a backup run incorrectly or fail, the client will be notified by an NPI account manager—feel secure in knowing what is going on with your data!
